Projects

1. Malicious Website Identification And Detection Using Machine Learning Approach-

The Project deals with the identification and detection of Malicious Website which or fake or hazard to use. We have added new features to the existing system to analyze and detect the malicious web pages. The main focus of the project is to increase the accuracy.

2. Wine Quality Prediction Using IBM Watson Machine Learning-

In this project, We present a wine quality prediction technique that utilizes historical data to train a simple machine learning model, which is accurate and help us know the quality of wine. We used IBM Watson Machine Learning to train our project. As a result it gives the quality of wine, Whether it's a good or bad wine.
